# **Data Structure**

### Homework 2

Deadline: 2021/11/10 Mon. 23:55

Task 1: (I/O: 35points, coding style: 5 points)

Please implement several basic operations related to linked list:

Creating a Node(with int value and linked list pointer)

Add a node to the linked list

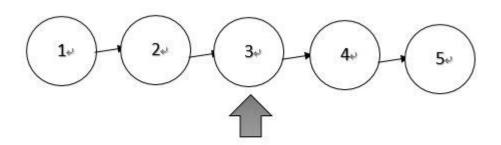

**Traversing the list** 

Reverse the linked list

Given total numbers of node and value, return the middle node of value and rest of the node of value and reverse linked list.

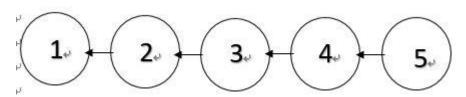

NOTICE: Your source code must be implemented in linked list or get zero point.

### **Example 1:**

The middle of node ₽

#### Reverse the linked list

#### Input:

1 2 3 4 5

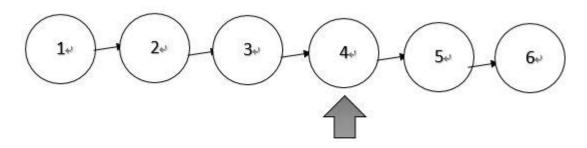

#### Output:

> 3 4 5

> 5 4 3 2 1

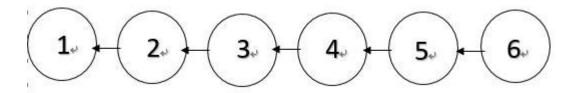

Explanation: The middle node of the list is node 3.

## Example 2:

The middle of node₽

### Reverse the linked list

### Input:

1 2 3 4 5 6

# Output:

> 4 5 6

> 6 5 4 3 2 1

**Explanation:** Since the list has two middle nodes with values 3 and 4, we return the second one.

# **Example:**

| Input             | Output         |
|-------------------|----------------|
| 1 2 3 4 5         | > 3 4 5        |
|                   | > 5 4 3 2 1    |
|                   |                |
|                   |                |
| Input             | Output         |
| Input 1 2 3 4 5 6 | Output > 4 5 6 |
| -                 | •              |

Task 2: (I/O: 35 points, coding style: 5 points)

Please implement several basic operations related to queue:

- 1. Add (Enqueue) elements at the end of the queue.
- 2. Output the front element of the queue.
- 3. Delete (Dequeue) the front element of the queue.

Assume user only input integers and right format. Your program has to read till the input row has only -1.

The program must be implemented by queue, or you will get zero points.

## **Input Description:**

If input "1", please read another integer x ( $1 \le x \le 10^{\circ}$ ) and enqueue the number. If input "2", print the front element. If the queue is empty, then output "> -2". If input "3", dequeue the front element. If the queue is empty, then output "> -3". If input "-1", terminate the program.

## **Example:**

| Input | Output                |
|-------|-----------------------|
| 3     | > -3 -2 1 3 4 -3 -2 5 |
| 2     |                       |
| 1 1   |                       |
| 1 2   |                       |
| 1 3   |                       |
| 2     |                       |
| 3     |                       |
| 3     |                       |
| 2     |                       |
| 1 4   |                       |
| 3     |                       |
| 2     |                       |
| 3     |                       |
| 3     |                       |
| 2     |                       |
| 1 5   |                       |
| 2     |                       |
| 3     |                       |
| -1    |                       |

Put the files below in the folder (folder name: studentID), and compress this folder as "studentID.zip".

- 1. Two source code files (filename: studentID\_1.c, studentID\_2.c)
- 2. One report with your coding environment (OS, IDE, ...), problems you encountered, and references. (filename: studentID.pdf) (10 points)

All the file names are correct, or you'll get zero points. (10 points)

You must hand in the assignment on time, or you will get zero points.

Warning: We encourage you to discuss assignments with each other. However, you have the responsibility to finish the assignments individually. Do not copy others' assignment, or you will get zero points.
